

Automate Windows Software Management with Chocolatey & Ansible

Adil Leghari
Senior Solutions Architect

Paul Broadwith
Senior Technical Engineer

Introductions

Who are these two voices from the ether?

Adil Leghari

Senior Solutions Architect
Chocolatey Software

🌐 Vancouver, Canada

- 15+ years in IT
- Govt. and Education sector
- PowerShell Community Speaker & Organizer
- Co-Host of BridgeConf and PNW-PSUG

Paul Broadwith

Senior Technical Engineer
Chocolatey Software

🌐 Glasgow, Scotland

- 25+ years in IT
- Financial, Govt., Mfg. and Svcs. sectors
- Lead Engineer on Boxstarter & cChoco DSC
- Cloud & Datacenter Management MVP

Audience

Dear Listener

- **Linux Admin** - familiar with package management frameworks, and interested in Windows side
- **Windows Admin** - looking for ways to use Ansible to better manage software on your servers and workstations
- **Cross-Platform Admin** - looking for a standardized approach to package management on Linux & Windows

What is Chocolatey?

Give me the CliffsNotes©.

TL; DR

Have you used `yum` or `apt` on Linux? 

It's like that. But for Windows. 

```
> choco
```

What is Chocolatey?

I'm intrigued. Explain further?

Chocolatey is a **complete package management system** for Windows that provides you total control over your software lifecycle. This includes:

- A PowerShell-based framework for installing, upgrading, and uninstalling applications
- A universal ".nupkg" packaging format (zips, scripts, binaries)
- A repeatable and pipeline-friendly automated approach to installation and patching
- Support for all current Windows OS's
- Access to over 8000 pre-made packages via Community Package Repository

```
> choco
```

Choose from Thousands of Community Packages

Chocolatey has the largest online registry of Windows packages. Chocolatey packages encapsulate everything required to manage a particular piece of software into one deployment artifact by wrapping installers, executables, zips, and/or scripts into a compiled package file.

Package submissions go through a rigorous moderation review process, including automatic virus scanning. The community repository has a strict policy on malicious and pirated software. [Read more.](#)

Why Chocolatey?

OK, and why should I add another thing to learn?

- Packaging on Windows is non-standard, almost by design (GUI-first)
- Your install, upgrade, and uninstall process is only as good as your packaging standard
- If it isn't easy to update/patch, it won't get done (security risk exposure 🦠)
- DevOps/Automation pipelines are not just the future, they're already here, and here to stay

Why Chocolatey & Ansible?

Make this easier for me!

- Certified Ansible Content Collection:
chocolatey.chocolatey (available in Ansible Automation Hub or Ansible Galaxy)
- Declaratively define your Chocolatey config., features, sources, and package state
- Speak the domain-specific language of Ansible Playbooks (YAML)
- Maintain **idempotence** (re-run playbooks without worry)
- Use Ansible Tower to manage scheduling, maintenance, and access

Modules

This collection provides the following modules you can use in your own roles:

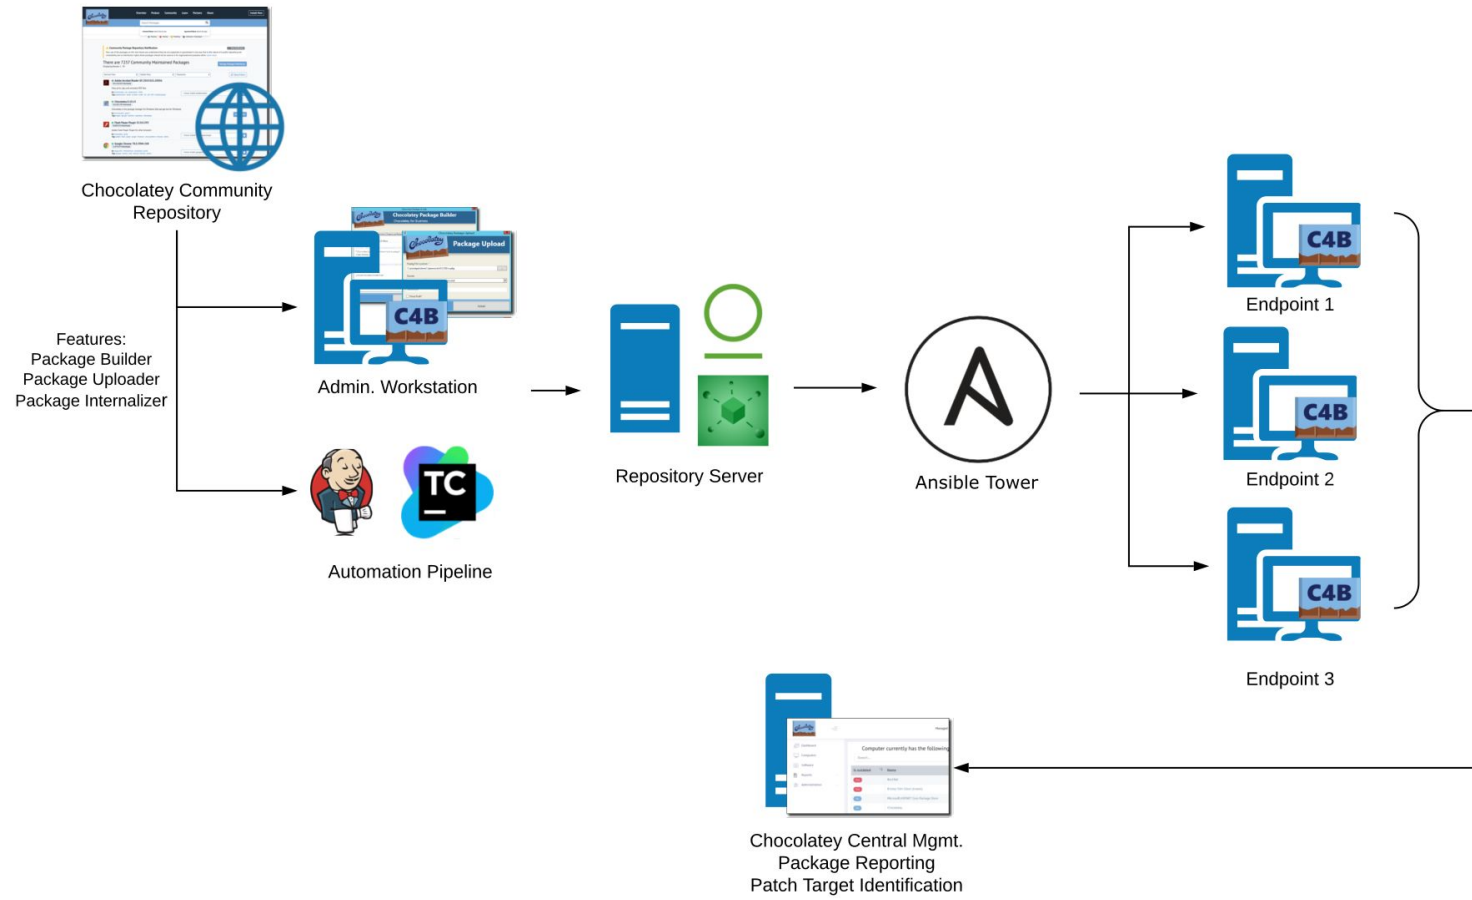

Name	Description
<code>win_chocolatey</code>	Manage packages using chocolatey
<code>win_chocolatey_config</code>	Manage Chocolatey config settings
<code>win_chocolatey_facts</code>	Create a facts collection for Chocolatey
<code>win_chocolatey_feature</code>	Manage Chocolatey features
<code>win_chocolatey_source</code>	Manage Chocolatey sources

Examples

Some example usages of the modules in this collection are below.

Upgrade all packages with Chocolatey:

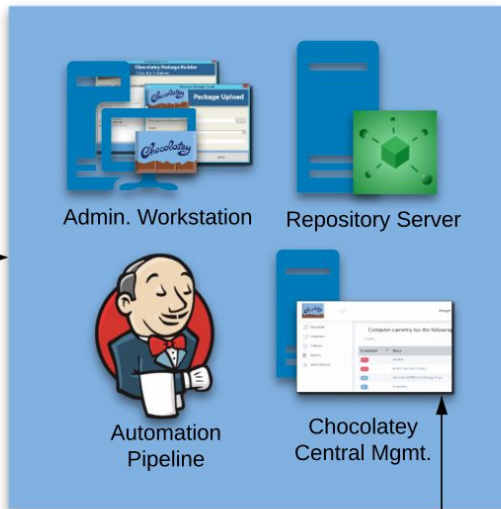

```
- name: Upgrade installed packages
  win_chocolatey:
    name: all
    state: latest
```

Chocolatey Community
Repository

Quick Deployment Environment

Ansible Tower

Chocolatey GUI &
Self-Service
